Check LH surge with.....

FERTICHECK-LH[®]

FERTICHECK-LH[®]

Rapid test for detection of luteinising hormone

The Luteinizing Hormone or LH is a hormone produced by the pituitary gland of menstruating females. The LH plays a vital role in making the woman fertile and plays a huge part in the conception of a child. LH surge is a phenomenon which occurs around mid-cycle in a menstruating female, around 12-48 hours before ovulation – releasing of the unfertilized egg from the ovary occurs.

LH is extremely important, especially for those women who are trying to get pregnant. The phenomenon of LH surge is used as a benchmark to find out when the female is ovulating so that couples can time their efforts to conceive more accurately. The conception of the child occurs from intercourse within the time frame of three days prior to or one day after the ovulation occurs.

FERTICHECK – LH is a rapid, semi-quantitative, two-site sandwich immunoassay for detection of human Luteinizing Hormone (hLH) concentration in urine. It is a 7-day ovulation test designed to predict the hLH-surge associated with ovulation time and the best probable time to plan conception.

FERTICHECK-LH[®]

- ▶ Simple single step test to predict fertile days.
- ▶ Excellent sensitivity – 40 mIU/ml.
- ▶ Easy identification of the LH surge.
- ▶ Convenient RT storage and 5 tests pack.
- ▶ Can be used independently or as an adjunct to Ultra-sound test.

**Pack Size
5 Test**
